Computer Programming

"How to solve the problem?"

"What is the problem?"

"Traditional" Programming

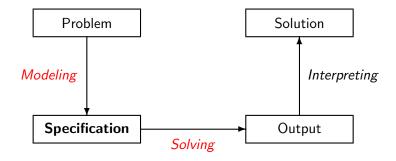

"How to solve the problem?"

"What is the problem?"

Declarative Programming

Motivation

00000

"How to solve the problem?"

versus

"What is the problem?"

Motivation

- Attractive tool for Knowledge Representation and Reasoning
 - Integration of deductive database, logic programming, knowledge representation and satisfiability solving techniques
 - Combinatorial search problems in the realm of NP and NP^{NP}
 - decision, optimization and query answering tasks
 - Succinct, elaboration-tolerant problem representations
 - rapid application development tool
 - Easy handling of knowledge-intensive applications
 - data, defaults, exceptions, frame axioms, reachability, etc.
- ► Efficient and versatile off-the-shelf solving technology
 - https://potassco.org/
 - https://www.mat.unical.it/DLV2/
- ► ASP has a growing range of applications, and it's good fun!

Radio Spectrum Reallocation

Motivation

00000

- Complex incentive auction by the US Federal Communications Commission
 - \sim 3000 sending stations
 - ~ 3 million interference restrictions

Radio Spectrum Reallocation

Motivation

- Complex incentive auction by the US Federal Communications Commission
 - ~ 3000 sending stations
 - ~ 3 million interference restrictions

Over 13 months in 2016–17 the US Federal Communications Commission conducted an "incentive auction" to repurpose radio spectrum from broadcast television to wireless internet. In the end, the auction yielded \$19.8 billion, \$10.05 billion of which was paid to 175 broadcasters for voluntarily relinquishing their licenses across 14 UHF channels. Stations that continued broadcasting were assigned potentially new channels to fit as densely as possible into the channels that remained. The government netted more than \$7 billion (used to pay down the national debt) after covering costs. A crucial element of the auction design was the construction of a solver, dubbed SATFC, that determined whether sets of stations could be "repacked" in this way; it needed to run every time a station was given a price quote. - Exactly one incoming edge per node
- All nodes reached from (arbitrary) start node
- Minimum sum of edge costs

```
{cycle(X,Y) : edge(X,Y,C)} = 1 :- node(X).
{cycle(X,Y) : edge(X,Y,C)} = 1 :- node(Y).

reached(X) :- #min{Y : node(Y)} = X.
reached(Y) :- cycle(X,Y), reached(X).
:- node(Y), not reached(Y).

:~ cycle(X,Y), edge(X,Y,C). [C,X,Y]
```

- Exactly one outgoing edge per node
- Exactly one incoming edge per node
- All nodes reached from (arbitrary) start node
- Minimum sum of edge costs

```
{cycle(X,Y) : edge(X,Y,C)} = 1 :- node(X).
{cycle(X,Y) : edge(X,Y,C)} = 1 :- node(Y).

reached(X) :- #min{Y : node(Y)} = X.
reached(Y) :- cycle(X,Y), reached(X).
:- node(Y), not reached(Y).

:~ cycle(X,Y), edge(X,Y,C). [C,X,Y]
```

- Exactly one outgoing edge per node
- Exactly one incoming edge per node
- All nodes reached from (arbitrary) start node
- Minimum sum of edge costs

```
{cycle(X,Y) : edge(X,Y,C)} = 1 :- node(X).
{cycle(X,Y) : edge(X,Y,C)} = 1 :- node(Y).

reached(X) :- #min{Y : node(Y)} = X.
reached(Y) :- cycle(X,Y), reached(X).
:- node(Y), not reached(Y).

:~ cycle(X,Y), edge(X,Y,C). [C,X,Y]
```

- Exactly one outgoing edge per node
- Exactly one incoming edge per node
- All nodes reached from (arbitrary) start node
- Minimum sum of edge costs

```
{cycle(X,Y) : edge(X,Y,C)} = 1 :- node(X).
{cycle(X,Y) : edge(X,Y,C)} = 1 :- node(Y).

reached(X) :- #min{Y : node(Y)} = X.

reached(Y) :- cycle(X,Y), reached(X).
:- node(Y), not reached(Y).

:~ cycle(X,Y), edge(X,Y,C). [C,X,Y]
```

- Exactly one outgoing edge per node
- Exactly one incoming edge per node
- All nodes reached from (arbitrary) start node
- Minimum sum of edge costs

```
{cycle(X,Y) : edge(X,Y,C)} = 1 :- node(X).
{cycle(X,Y) : edge(X,Y,C)} = 1 :- node(Y).

reached(X) :- #min{Y : node(Y)} = X.
reached(Y) :- cycle(X,Y), reached(X).
:- node(Y), not reached(Y).

:~ cycle(X,Y), edge(X,Y,C). [C,X,Y]
```

- Exactly one outgoing edge per node
- Exactly one incoming edge per node
- All nodes reached from (arbitrary) start node
- Minimum sum of edge costs

```
{cycle(X,Y) : edge(X,Y,C)} = 1 :- node(X).
{cycle(X,Y) : edge(X,Y,C)} = 1 :- node(Y).

reached(X) :- #min{Y : node(Y)} = X.
reached(Y) :- cycle(X,Y), reached(X).
:- node(Y), not reached(Y).

:~ cycle(X,Y), edge(X,Y,C). [C,X,Y]
```

Motivation

- Exactly one outgoing edge per node
- Exactly one incoming edge per node
- 4 All nodes reached from (arbitrary) start node
- Minimum sum of edge costs

Problem Encoding

```
\{cvcle(X,Y) : edge(X,Y,C)\} = 1 :- node(X).
\{cycle(X,Y) : edge(X,Y,C)\} = 1 :- node(Y).
reached(X) := \#min\{Y : node(Y)\} = X.
reached(Y) := cycle(X,Y), reached(X).
:- node(Y), not reached(Y).
\sim \text{cycle}(X,Y), \text{edge}(X,Y,C). [C,X,Y]
```

More encoding "optimization" feasible

```
node(1). node(2). node(3). node(4). node(5). node(6).
edge(1,2,2).
edge(1,3,3). edge(3,1,3).
edge(1,4,1). edge(4,1,1). ...
\{cycle(X,Y) : edge(X,Y,C)\} = 1 :- node(X).
\{cycle(X,Y) : edge(X,Y,C)\} = 1 :- node(Y).
reached(X) := \#min\{Y : node(Y)\} = X.
reached(Y) := cycle(X,Y), reached(X).
:- node(Y), not reached(Y).
\sim \text{cycle}(X,Y), \text{edge}(X,Y,C). [C,X]
```

```
node(1). node(2). node(3). node(4). node(5). node(6).
edge(1,2,2).
edge(1,3,3). edge(3,1,3).
edge(1,4,1). edge(4,1,1). ...
\{cycle(1,Y) : edge(1,Y,C)\} = 1 :- node(1).
\{cycle(X,Y) : edge(X,Y,C)\} = 1 :- node(Y).
reached(X) := \#min\{Y : node(Y)\} = X.
reached(Y) := cycle(X,Y), reached(X).
:- node(Y), not reached(Y).
\sim \text{cycle}(X,Y), \text{edge}(X,Y,C). [C,X]
```

```
node(1). node(2). node(3). node(4). node(5). node(6).
edge(1,2,2).
edge(1,3,3). edge(3,1,3).
edge(1,4,1). edge(4,1,1). ...
\{cycle(1,Y) : edge(1,Y,C)\} = 1.
\{cycle(X,Y) : edge(X,Y,C)\} = 1 :- node(Y).
reached(X) := \#min\{Y : node(Y)\} = X.
reached(Y) := cycle(X,Y), reached(X).
:- node(Y), not reached(Y).
\sim \text{cycle}(X,Y), \text{edge}(X,Y,C). [C,X]
```

```
node(1). node(2). node(3). node(4). node(5). node(6).
edge(1,2,2).
edge(1,3,3). edge(3,1,3).
edge(1,4,1). edge(4,1,1). ...
{cycle(1,2); cycle(1,3); cycle(1,4)} = 1.
\{cycle(X,Y) : edge(X,Y,C)\} = 1 :- node(Y).
reached(X) := \#min\{Y : node(Y)\} = X.
reached(Y) := cycle(X,Y), reached(X).
:- node(Y), not reached(Y).
\sim \text{cycle}(X,Y), \text{edge}(X,Y,C). [C,X]
```

Motivation

(Intelligent) Grounding

```
node(1). node(2). node(3). node(4). node(5). node(6).

Outline

Motivation

2 ASP in a Nutshell

- 3 Linux Package Configuration
- 4 Conclusion

Free and Open Source Software Management

- Maintaining packages in modern Linux distributions is difficult
 - Complex dependencies
 - Large package repositories
 - Ever changing in view of software development
- Challenges for package configuration tools
 - Large problem size
 - Soft (and hard) constraints
 - Multiple optimization criteria
- Targeted in the EU research project Mancoosi
 - Contributions of ASP
 - Uniform modeling by encoding plus instances
 - Solving techniques for (multi-criteria) optimization

Setting the Focus

Scenario

► Modern Linux distributions are large (50K packages or more)

Linux Package Configuration

Problem representation and search space are of significant size

- ► Some packages can't be installed (remove or upgrade goals)

Setting the Focus

Scenario

- ► Modern Linux distributions are large (50K packages or more)
- Problem representation and search space are of significant size

Observations

- Some packages can't be installed (remove or upgrade goals)
- An empty installation is conflict-free and thus valid
- Packages to install should serve (hard) install or upgrade goals, or satisfy (soft) constraints

Approach

- Identify packages whose installation may be of direct use
- Saturate such packages wrt. dependencies and soft constraints
- Restrict the ASP instance to closure of "interesting" packages
- (Greedily) partition these packages into mutual conflict cliques

Linux Package Configurator aspcud

Motivation

Preprocessor Converts CUDF input to ASP instance **Encoding** First-order problem specification Grounder Instantiates first-order variables Solver Searches for (optimal) answer sets

Linux Package Configurator aspcud: Encoding

Encoding First-order problem specification

Hard Constraints

- Can install any installable package
- Excluded, included, and satisfied conditions (packages) follow

Linux Package Configuration

Respective conditions and user goals must be fulfilled

Problem Encoding

```
\{install(P,V)\}:-package(P,V).
exclude(C) :- install(P,V), conflicts(P,V,C).
include(C) :- install(P,V), depends(P,V,C).
satisfy(C) :- install(P,V), satisfies(P,V,C).
:- exclude(C), satisfy(C).
:- include(C), not satisfy(C).
:- request(C), not satisfy(C).
```

Hard Constraints

- Can install any installable package
- Excluded, included, and satisfied conditions (packages) follow

Linux Package Configuration

Respective conditions and user goals must be fulfilled

Problem Encoding

```
\{install(P,V)\}:-package(P,V).
exclude(C) :- install(P,V), conflicts(P,V,C).
include(C) :- install(P,V), depends(P,V,C).
satisfy(C) :- install(P,V), satisfies(P,V,C).
:- exclude(C), satisfy(C).
:- include(C), not satisfy(C).
:- request(C), not satisfy(C).
```

Hard Constraints

- Can install any installable package
- Excluded, included, and satisfied conditions (packages) follow

Linux Package Configuration

Respective conditions and user goals must be fulfilled

Problem Encoding

```
\{install(P,V)\}:-package(P,V).
exclude(C) :- install(P,V), conflicts(P,V,C).
include(C) :- install(P,V), depends(P,V,C).
satisfy(C) :- install(P,V), satisfies(P,V,C).
:- exclude(C), satisfy(C).
:- include(C), not satisfy(C).
:- request(C), not satisfy(C).
```

- Can install any installable package
- Excluded, included, and satisfied conditions (packages) follow

Linux Package Configuration

Respective conditions and user goals must be fulfilled

Problem Encoding

```
\{install(P,V)\}:-package(P,V).
exclude(C) :- install(P,V), conflicts(P,V,C).
include(C) :- install(P,V), depends(P,V,C).
satisfy(C) :- install(P,V), satisfies(P,V,C).
:- exclude(C), satisfy(C).
:- include(C), not satisfy(C).
:- request(C), not satisfy(C).
```

Motivation

- Package additions and deletions
- Version changes

```
install(P) :- install(P,V).
installed(P) :- installed(P,V).
violate(newpkg,L,P) :-
    utility(newpkg,L), install(P), not installed(P).
violate(delete.L.P) :-
    utility(delete,L), installed(P), not install(P).
violate(change,L,P) :-
    utility(change,L), installed(P,V), not install(P,V).
violate(change,L,P) :-
    utility(change,L), install(P,V), not installed(P,V).
\sim \text{violate}(U,L,T). [10L,U,T]
```

Motivation

- Package additions and deletions
- Version changes

```
install(P) :- install(P,V).
installed(P) :- installed(P,V).
violate(newpkg,L,P) :-
    utility(newpkg,L), install(P), not installed(P).
violate(delete.L.P) :-
   utility(delete,L), installed(P), not install(P).
violate(change,L,P) :-
   utility(change,L), installed(P,V), not install(P,V).
violate(change,L,P) :-
    utility(change,L), install(P,V), not installed(P,V).
:\sim violate(U,L,T). [10L,U,T]
```

violate(change,L,P) :-
    utility(change,L), install(P,V), not installed(P,V).
\sim \text{violate}(U,L,T). [10L,U,T]
```

Linux Package Configurator aspcud

Motivation

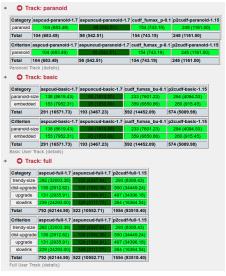

Preprocessor Converts CUDF input to ASP instance **Encoding** First-order problem specification Grounder Instantiates first-order variables Solver Searches for (optimal) answer sets

Linux Package Configurator aspcud: Reasoning

Linux Package Configuration

Grounder Instantiates first-order variables Solver Searches for (optimal) answer sets Encoding using conflict cliques and core-guided optimization

Outline

Motivation

2 ASP in a Nutshell

3 Linux Package Configuration

4 Conclusion

Further Remarks

- Virtually all application problems require optimization
 - objective functions
 - lexicographic (multi-)criteria
- ► Complex criteria like ⊆-minimality or Pareto efficiency by
 - meta-programming (disjunctive ASP)
 - asprin framework
- Multi-shot solving, domain heuristics and theory reasoning
 - clingo
 - clingo[DL]
 - clingo[LP]
 - clingcon
 - DLV2
 - dlvhex
 - EZCSP
 - EZSMT
 - IDP
 - wasp
 - ASP tools (by Aalto SCI)
